

ROOT/SHOOT CULTURING

To grow a healthy forest, your seedlings must start out with a proper balance between what's above the ground (transpiration surface) and what's below the ground (absorption surface) so that there's a balance between water uptake and water loss. Seedlings that have the

proper shoot/root ratio are better adapted to survive and grow when they encounter droughty first-year growing conditions. Weyerhaeuser uses patented growing processes to ensure that seedlings meet targeted specifications.

Weyerhaeuser Premium Seedlings are Cultured to Provide Optimum Survival and Growth
