We avoid disrupting breeding activities for sensitive species such as bald eagles. We take special measures to protect rare, threatened and endangered species.

We leave tree buffers along waterways to reduce siltation and protect aquatic habitat. Our lands provide recreation opportunities, and renewable energy such as wind and solar.

After harvest, we leave snags, stumps, and scattered live trees for habitat. On average, we harvest only two percent of our forests each year. We clearcut because it requires fewer roads and is the safest, most efficient method of harvest.

Our growing trees absorb carbon dioxide and our wood products store carbon for their entire life cycle. Open spaces allow sunlight to reach tree species that grow quickly and are shade-intolerant. Making wood products requires fewer fossil fuels than it takes to make steel and concrete.

We sell logs to our own mills and other mills. We also export logs and wood products. Our mills run as efficiently as possible, which is good for our bottom line and the environment. We've reduced our greenhouse gas emissions by more than 50 percent since 2000.

Our innovative products help customers increase efficiency and reduce waste on jobsites. Other companies buy our wood to make products such as millwork and furniture. In the future, more tall buildings will be made from mass timber products.

Most of our wood products are used to build homes where people live and raise their families. Our products make life better. Wood products are certainly beautiful, but they're also fundamental. Most of our products are used to build homes where people live and raise their families.
Our forests provide much more than timber. They are thriving, healthy ecosystems. As trees grow, they absorb carbon dioxide from the atmosphere, turn it into carbon and store it in their trunks, limbs, roots and leaves. During that process, trees release oxygen into the atmosphere for us to breathe. When we harvest a tree and make it into a wood product, the carbon remains stored in the wood for the life of the product. When we replant our forests, the continuous cycle of growing trees and storing carbon starts all over again. Wood production consumes less energy, emits fewer greenhouse gases, releases fewer pollutants, stores more carbon and generates much less water pollution compared with other building materials like steel and concrete. Most homes in North America are built with wood, and now more tall buildings are being constructed using mass timber products. Wood is safe, durable, and beautiful. And because we manage our forests sustainably, we can keep producing wood forever. We focus on environmental stewardship because it’s the right thing to do, and because our long-term success depends on a healthy, sustainable supply of trees. We also depend on strong relationships with our communities because without their support, we can’t operate. And perhaps most of all, we depend on a constant flow of diverse, talented people who are excited to join our team and build a long-term career at our company. Our sustainability story began nearly 120 years ago, and we intend to be here for another century and more.
