

Position on Preservative Treated Glued Laminated Timber Products

Weyerhaeuser Distribution will only facilitate the sale of treated structural glued laminated (glulam) timber products that are:

- Manufactured and identified in accordance with ANSI A190.1 and ASTM D3737.
- Guaranteed via warranty by the glulam manufacturer and preservative chemical supplier.
- Treated with an AWPB approved preservative treatment.

There is currently no manufacturer of treated glulam beams in the Western United States that complies with Weyerhaeuser's requirements. As an alternative to preservative treatment, use a building code accepted glulam manufactured with naturally durable wood. Alaskan Yellow Cedar or Port Orford Cedar Glulam are available from several manufacturers. If a glulam is not desired, another option, available in eastern markets only, is Trus Joist® Treated Parallam® Plus PSL with Preservative Protection.

Special Note on Transportation to Wood Treaters

Weyerhaeuser Distribution will not facilitate the shipping of untreated glulam products on behalf of the dealer to a treatment facility. Exceptions may be possible with the involvement of the glulam manufacturer, designer of record, and proper specification per American Wood Protection Association (AWPA) requirements.

This position statement only applies to Weyerhaeuser Distribution's transportation of treated glulam products. For a list of products provided at Weyerhaeuser Distribution Center refer to weyerhaeuser.com/woodproducts/distribution/.

**If you have any questions, please contact
your Weyerhaeuser representative.**
