

TJI® Joists Header-Off Span Table

For certain situations, a typical repair detail may not be sufficient or there may not be enough room to install the required repair materials. In such cases, the most common method of repairing the damaged TJI® joist is to install a header on either side of the damaged region and attach the header(s) to the adjacent, undamaged TJI® joists. This repair technique is typically referred to as **Header-Off** or **Headered-Off**.

Tables 1 gives the maximum allowable clear spans for both the damaged TJI® joist and the adjacent, undamaged TJI® joists. **Detail H2A** provides supplementary information regarding the installation of a Header-Off repair.

General Notes

- Table is based on:
 - Limit States Design, per CSA 086.
 - Uniform loads.
 - Live load deflection criteria of L/480.
 - More restrictive of simple or continuous span.
 - Clear distance between supports.
 - Minimum bearing length of 1¾" end (no web stiffeners) and 3½" intermediate (no web stiffeners).
 - Assumed composite action with a single layer of 24" on-center span-rated, glue-nailed floor panels for deflection only.
 - NBCC vibration criteria has not been considered; use minimum of table or vibration-controlled span.
- For continuous spans, ratio of short span to long span should be 0.4 or greater to prevent uplift.
- Tables show maximum allowable clear span of damaged joist and adjacent joists for **Header-Off** repair.
 - Assumes worst case of moment, shear, reaction, and deflection controls.
- Use proper backer blocks and hangers (Simpson Strong-Tie® IUS or better) on adjacent joists.
- Verify existing holes in TJI® joists are still acceptable prior to installing header.
- 12" maximum spacing between headers.

See Specifier's Guide for TJI Joists – Canada (TJ-4500) for additional information and installation details.
